Análise Avançada de Dados Quantitativos 2019-1

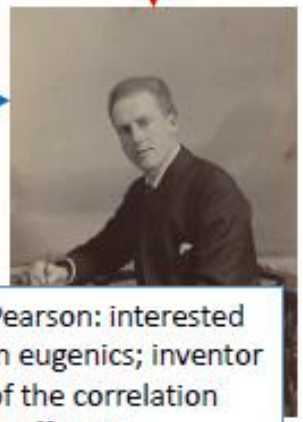
Prof. Dr. Wagner de Lara Machado

Founders of statistics

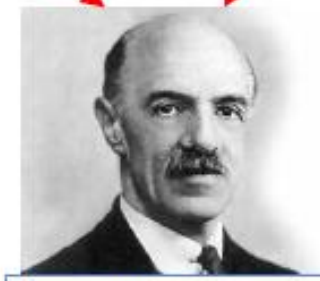
Galton: interested in individual differences, and the heretability of intelligence; founder of eugenics.

Wundt: interested in the general mind; used N=1 research, with replication and introspection

Fisher: realized we need to take sample fluctuation into account; F-test, ANOVA; hypothesis testing.



Pearson: interested in eugenics; inventor of the correlation coefficient.



Spearman: realized measurements contain measurement error; developed factor analysis to correct for this.

Gosset/Student: t-test

Tipos de variáveis

QUALITATIVAS		QUANTITATIVAS	
NOMINAIS OU CATEGÓRICAS	ORDINAIS	DISCRETAS	CONTÍNUAS
Sexo Cor do olho Profissão	NSE Nivel educacional Escalas likert	NÚMEROS NATURAIS (nº DE OBJETOS)	Altura Idade Tempo de reação

Níveis de mensuração

Nominal	Ordinal	Intervalar	Razão
Podemos atribuir números como rótulo, porém sem manter as propriedades dos números. Ex. Sexo 1 – Masculino 2 – Feminino	É possível estabelecer uma ordem de grandeza ou magnitude, porém a distância não é conhecida. Ex. Dureza dos materiais Nível educacional 1 – Fundamental 2 – Médio 3 – Superior 4 – Pós-graduação	A distância entre as unidades de medida é conhecida, podem ser realizadas a maioria das operações matemáticas. Ex. Escores modelados de instrumentos psicométricos	Escala intervalar com um zero conhecido e não arbitrário. Ex. Quando zero significa ausência do atributo

Questões sobre método

- Tipos (papéis) de variáveis
  - Confundidora
  - Controle
  - Dependente
  - Independente
  - Binária ou dicotômica
  - Covariável
  - Critério
  - “Dummy”
  - Endógena
- Exógena

- Observada
- Mediadora
- Moderadora
- Preditora
- Desfecho
- Instrumental

Questões sobre método quantitativo

FREQUENTISTA	BAYESIANA
P(D|H)	P(H|D)

- Inferência estatística, teste de hipótese

Sendo D = dados e H = hipótese

- Interpretação do “p” ou Bayes Factor 0,4

Software R

- R Project

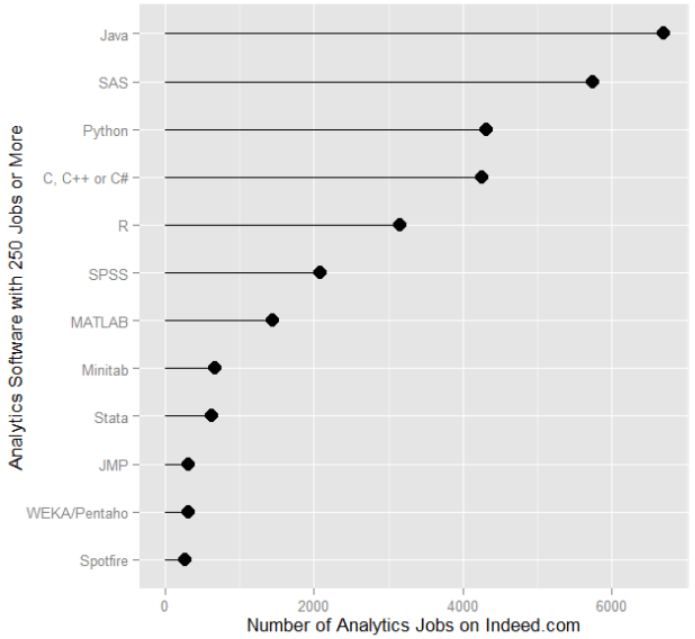
- John Chambers
- Software livre, colaborativo
- Possui um repositório CRAN
- Bibliotecas e pacotes (códigos e algoritmos)
- 100% FREE!!!

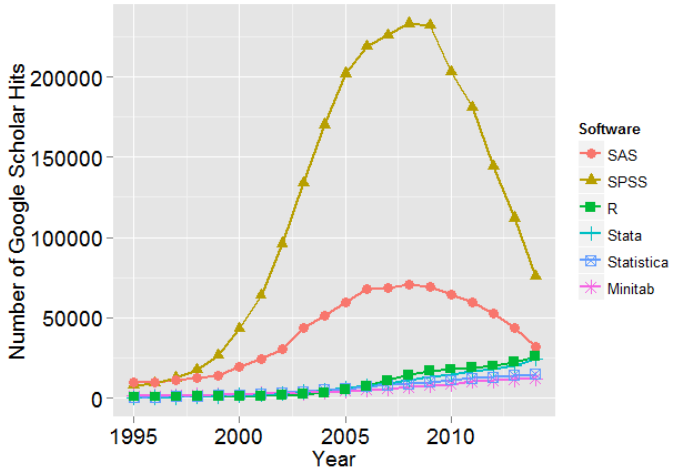
O quê é a linguagem r?

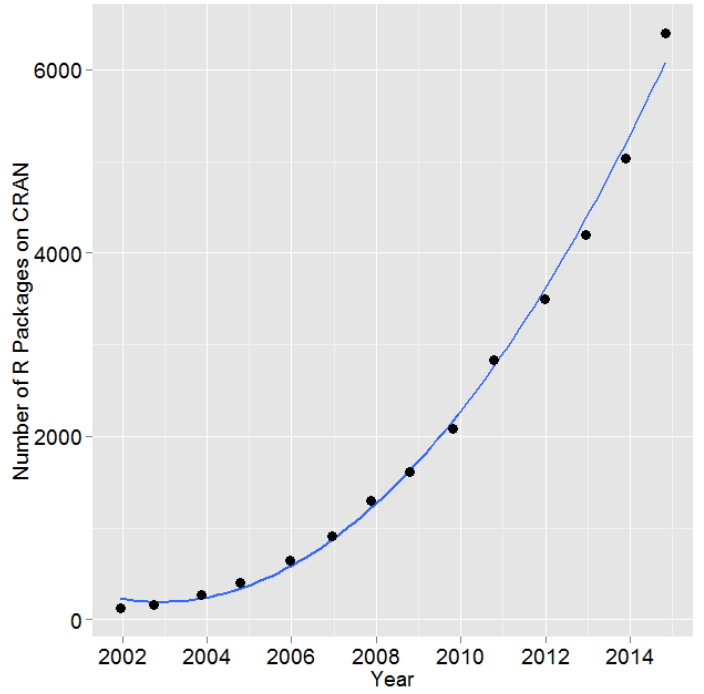
- R é um “dialeto” da linguagem S
- 1993 R é lançado ao público
- 1995 General Public License
- 1997 o R Core Group é formado – Controla a fonte de códigos do R
- 2000 R version 1.0.0 é lançado
- 2015 version 3.2.1

Porquê usar a linguagem r?

- Capacidades gráficas muito sofisticadas e melhores que muitos softwares
- Linguagem de programação que possibilita o desenvolvimento de novas ferramentas
- Comunidade de usuários muito ativa e participativa







Porquê usar a linguagem r?

Porquê usar a linguagem r?

Personality Project

Quick-R
powered by DataCamp

DataCamp

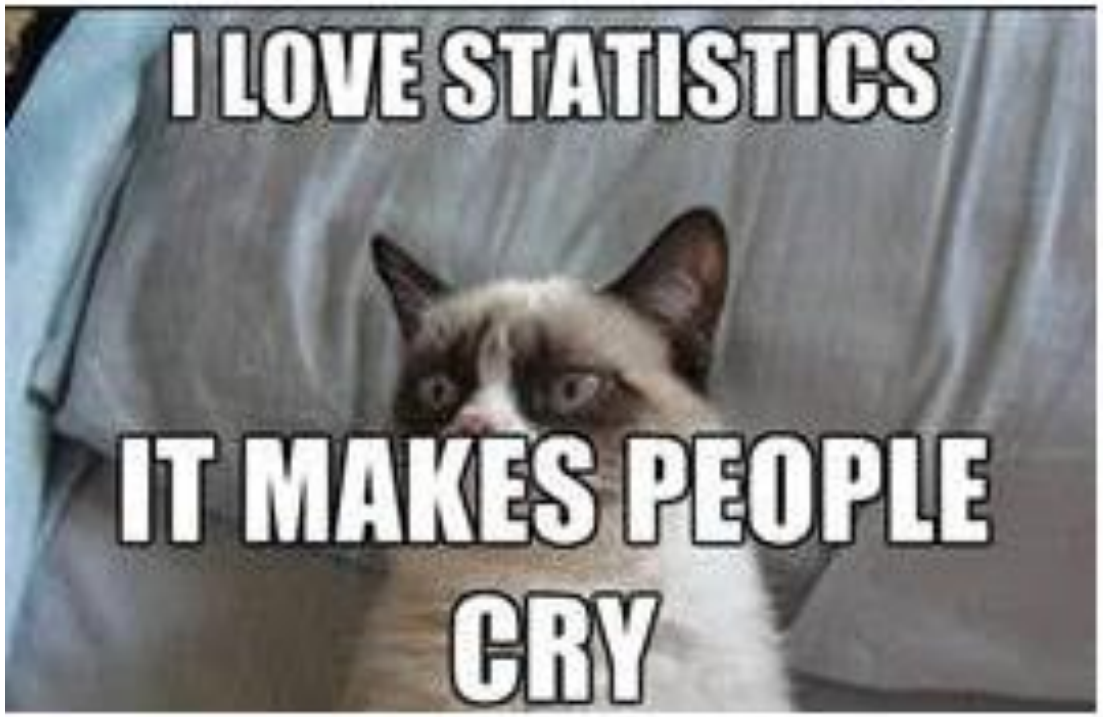
Passos inicias

- É o sistema básico – feito de forma colaborativa – Possui funções básicas que podem ser combinadas em pacotes mais avançados

- R Studio – Uma interface mais amigável para o uso do R. Permite análise, escrita (tem gente que escreve a tese por aqui), e publicações.

R desing

- O sistema R é divido em duas partes:
  - A “base” do sistema R que pode-se fazer o download no CRAN
  - Todo o resto – Funcionalidades chamadas de packages
  - Atualmente existem mais de 6000 packages



gibbs.cpp

Source on Save | Source

```cpp
#include <Rcpp.h>
using namespace Rcpp;

// [[Rcpp::export]]
NumericMatrix gibbs(int N, int thin) {

  NumericMatrix mat(N, 2);
  double x = 0, y = 0;

  for(int i = 0; i < N; i++) {
    for(int j = 0; j < thin; j++) {
      x = R::rgamma(3.0, 1.0 / (y * y + 4));
      y = R::rnorm(1.0 / (x + 1), 1.0 / sqrt(2 * x + 2));
    }
    mat(i, 0) = x;
    mat(i, 1) = y;
  }

  return(mat);
}
```

The R Project for Statistical Computing

Getting Started

R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To **download R**, please choose your preferred CRAN mirror.

If you have questions about R like how to download and install the software, or what the license terms are, please read our answers to frequently asked questions before you send an email.

News

- **R version 3.5.1 (Feather Spray)** has been released on 2018-07-02.
- The R Foundation has been awarded the Personality/Organization of the year 2018 award by the professional association of German market and social researchers.
- **R version 3.5.0 (Joy in Playing)** has been released on 2018-04-23.

Positive Mental Health Scale: Validation of the *Mental Health Continuum – Short Form*

Wagner de Lara Machado – Pontifícia Universidade Católica de Campinas, Campinas, São Paulo, Brasil
Denise Ruschel Bandeira – Universidade Federal do Rio Grande do Sul, Porto Alegre, Brasil

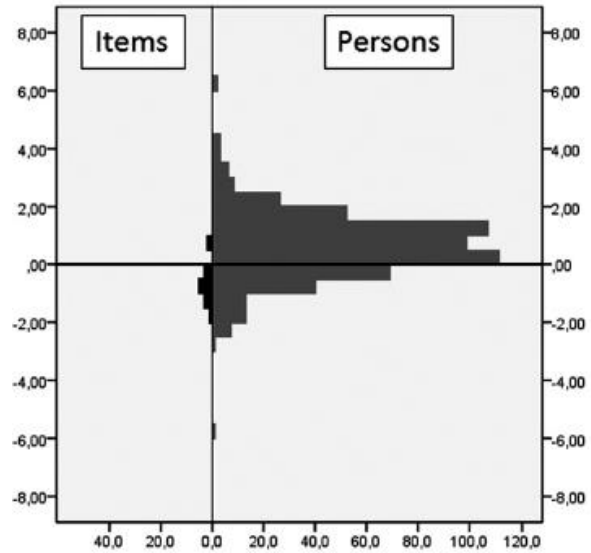

Figure 1. Map of items and persons. The vertical axis indicates the scale in *logits*. The distribution was obtained by fixing the contrary measure so the mean would be equal to zero.

Table 2
Item Factor Loadings and Reliability Measures of the MHC-SF in the Bifactor Model

Item (summarized content)	Factor loading			
	General factor	EWB	SWB	PWB
1 – Happy	.70	.65		
2 – Interested	.78	.32		
3 – Satisfied	.78	.36		
4 – Contribute to society	.69		.07	
5 – Belong to community	.67		.23	
6 – Society is becoming a better place	.62		.63	
7 – People are good	.62		.41	
8 – Way society works makes sense	.57		.56	
9 – Likes own personality	.79			.21
10 – Manages responsibility well	.70			.19
11 – Relationships with others	.72			.24
12 – Grow and become a better person	.62			.39
13 – Confident to express own ideas	.68			.52
14 – Life has direction or meaning	.83			.12
Average extracted variance	.49	.22	.19	.10
Composite reliability	.93	.43	.47	.34

Note. EWB = emotional well-being, SWB = social well-being, PWB = psychological well-being.

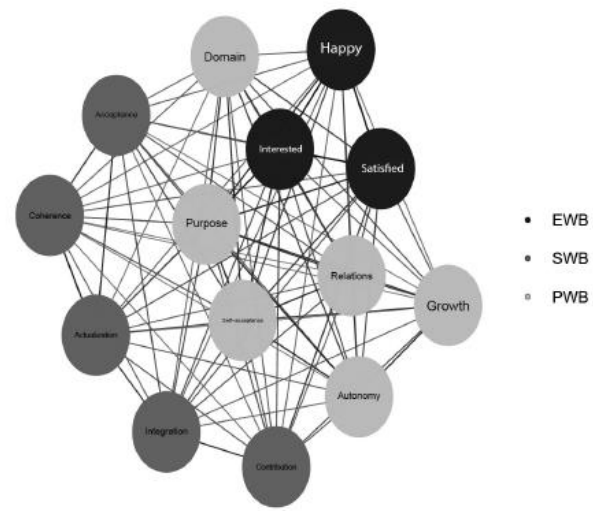

Figure 2. Network of positive mental health indicators. The covariance structure indicates that the MHC-SF items are strongly associated with the others, resulting in a dense component. The items in the emotional (EWB), social (SWB) and psychological (PWB) well-being subscales exhibit moderate to strong crossed associations. Purpose in life and self-acceptance are the central nodes of the system, meaning that they are more strongly associated with the remainder of the items. The stronger line represents the correlation between "happy" and "satisfied" ($r_{1\text{-}3}$ = .78); the fainter line represents the correlation between "relations" and "coherence" ($r_{8\text{-}11}$ = .35).

The Experience of Sexual Stigma and the Increased Risk of Attempted Suicide in Young Brazilian People from Low Socioeconomic Group

Angelo Brandelli Costa[1]*, *Andrew Pasley*[2], *Wagner de Lara Machado*[3], *Ernesto Alvarado*[4], *Luciana Dutra-Thomé*[4] *and Silvia Helena Koller*[4]

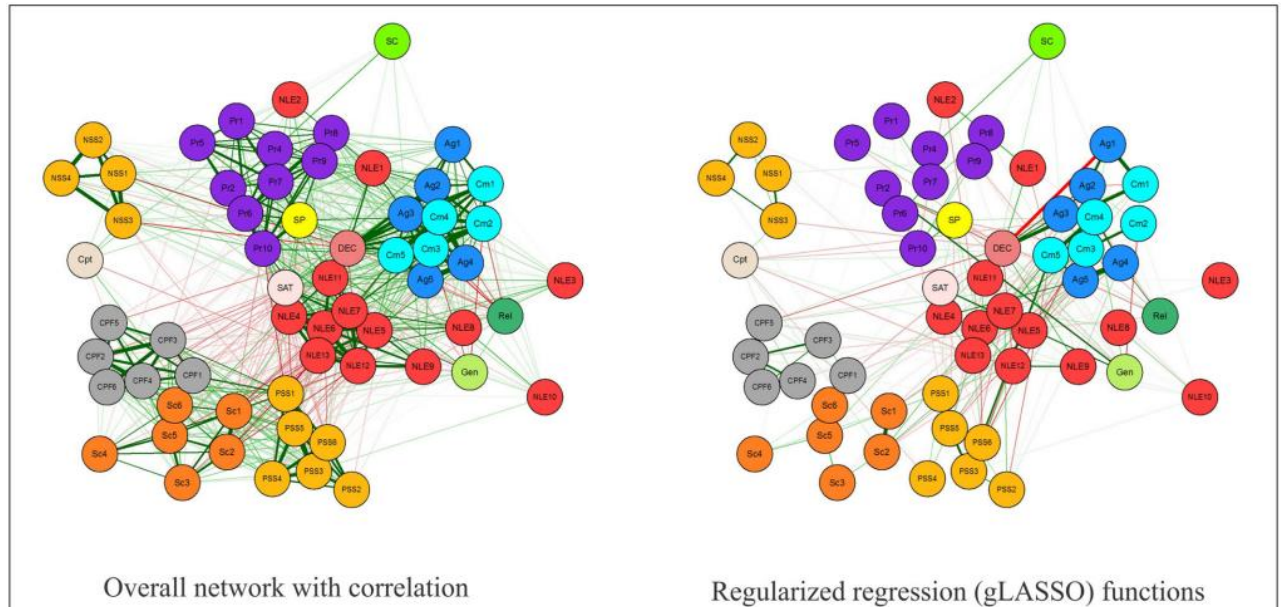

FIGURE 1 | Overall network with correlation (left) and regularized regression (gLASSO) functions **(right)**. Variables names match those in **Table 1**.

This study was intended to analyze the intersection of experience of sexual stigma low-socioeconomic status, and suicide attempt amongst young Brazilians (11–24 years old). In each of the data collection periods (2004–2006: $n = 7185$; 2010–2012: $n = 2734$), participants completed a questionnaire-based instrument. Network analysis provided support for a Minority Stress Model, oriented around whether participants had experienced sexual stigma. Although suicide attempts decreased by 20% for participants

Psychometric Perspectives on Diagnostic Systems

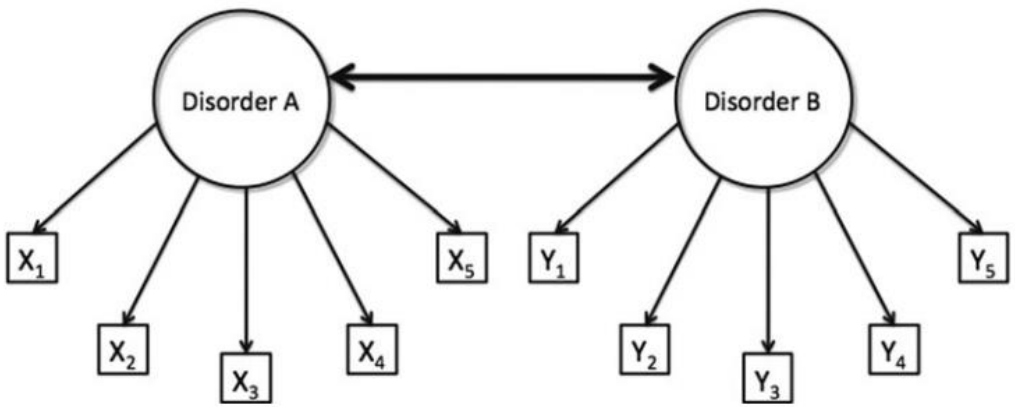

Figure 1. A model of comorbidity between disorders A and B, under the standard assumptions of latent variable modeling. The *circles* represent the disorders (i.e., latent variables) and the *rectangles* represent the observable core symptoms of those disorders (i.e., $X_1 - X_5$ for disorder A, and $Y_1 - Y_5$ for disorder B). In this model, comorbidity is viewed as a correlation between the latent variables, visualized by the *thick bidirectional edge* between disorders A and B.

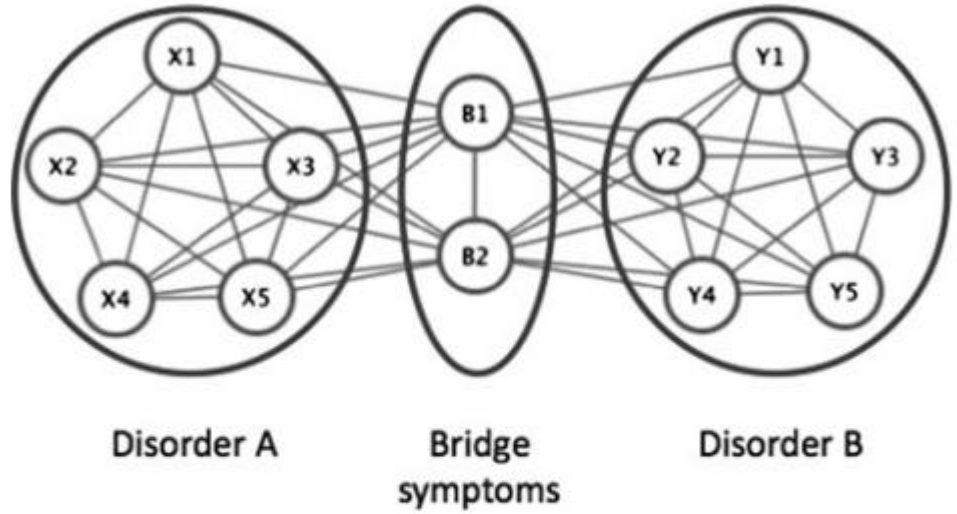

Figure 2. Comorbidity under a network approach. Disorder A consists of bidirectionally related symptoms $X_1 - X_5$, and disorder B consists of symptoms $Y_1 - Y_5$. Symptoms B_1 and B_2 are *bridge symptoms* that overlap between disorders A and B. In this model, comorbidity arises as a result of direct relations between the bridge symptoms of two disorders.

Network Analysis: An Integrative Approach to the Structure of Psychopathology
